

SCI-off calibration status

The time history of the center energy and energy resolution of Mn K from the Fe calibration sources for all XIS sensors (segment A&D). Note that the vertical axis of energy resolution is additional sigma($\Delta \sigma$) in comparison with the ground calibration. If you want FWHM, calculate $\text{FWHM(eV)} \sim \sqrt{(130 \text{ eV})^2 + (2.355 * \Delta \sigma \text{ eV})^2}$

We show 2 version : **LATEST**(makepi20080131)

and **PREVIOUS**(makepi before 08/1/31

:same vesion with technicaldiscription!!)
